

- 1 Methods used in the study of diversity and species richness
part 2
- 2 Lecture layout
- 3 The two key attributes
- 4 The species acquisition curve and richness
- 5 The species acquisition curve and richness
- 6 Comparing collections - rarefaction
- 7 The calculation of rarefaction curves
- 8 An example of rarefaction
- 9 An example of rarefaction
- 10 Plotting rarefaction curves
- 11 Published views on rarefaction
- 12 A situation where rarefaction fails
- 13 The calculation of sample interpolation curves
- 14 An example application of sample interpolation
- 15 A second example of sample interpolation
- 16 Estimating species richness
- 17 A community of methods
- 18 Observations on the use of the Michealis-Menten equation
- 19 Chao presence/absence
- 20 Chao quantitative
- 21 First order jackknife
- 22 Relative performance with model systems
- 23 Brose, Martinez & Williams protocol
- 24 Relative performance with mobile communities
- 25 Brose & Martinez protocol
- 26 What do published studies recommend- spiders?
- 27 What do published studies recommend - ants?
- 28 What do published studies recommend - diptera?
- 29 What do published studies recommend - diptera?
- 30 What do published studies recommend - parasites?
- 31 In summary
- 32 β - diversity
- 33 A choice of β - diversity measures
- 34 An example application of β - diversity
- 35 An example application of β - diversity
- 36 An example application of β - diversity
- 37 Special scores for habitat quality - BMWP
- 38 BMWP family scores
- 39 References
- 40 Software
